Summary

The results from the monitoring at the farming site Laugardalur 1 in September 2024 showed that the sediment was somewhat loaded with organic carbon and the copper level in the sediment at C1 was somewhat elevated (52.4 mg/kg) and is categorized into environmental limit II or "low values". EMB concentration was 550 ng/kg and thus exceeds the defined concentration of 272 ng/kg for stations outside the mixing zone. Accordingly, the station is not fulfilling the "good status standard".

Some load effects were recorded in the fauna at three stations with faunal index nEQR below 0.6. At C2 the nEQR values was above 0.6 indicating relatively good faunal conditions at this station. The diversity H' varied from 2.70 to 3.55. The NS 9410:2016-assessment of the community in the local impact zone (C1) showed environmental condition 1 (Very good). A pollution indicator species was found among the most dominant species at C1, but not at the other stations.

The redox measurements (pH/Eh) gave point 0 acc. Appendix D in NS 9410:2016 for all the sampling stations. The oxygen saturation in September was good in the whole water column with 82 % in the bottom water.

Preface

Akvaplan-niva carried out a type C (NS 9410:2016) environmental survey at the Laugardalur 1 site. It includes pH/redox measurements (Eh), hydrography, geochemical analyses, and analyses of the bottom fauna from four stations at the fish farming site. The following personnel contributed:

Snorri Gunnarsson	Akvaplan-niva	Field work, report, project leader.
Hans-Petter Mannvik	Akvaplan-niva	Identification of bottom fauna (Echinodermata). Report, professional assessments, and interpretations.
Kamila Sztybor	Akvaplan-niva	QA report, professional assessments, and interpretations.
Roger Velvin	Akvaplan-niva	Identification of bottom fauna (Various taxa).
Rune Palerud	Akvaplan-niva	Identification of bottom fauna (Crustaceans). Statistics.
Jesper Hansen	Akvaplan-niva	Identification of bottom fauna (Polychaeta and Mollusca).
Vegard Holen	Akvaplan-niva	Hydrographical vertical profiles
Kristine H Sperre	Akvaplan-niva	Coordination of sorting of bottom fauna.
Lisa Torske	Akvaplan-niva	Coordination of geo-chemical analyses.

Akvaplan-niva would like to thank Arnarlax ehf and Silja Baldvinsdóttir for good cooperation.

Accreditation information:

The survey was carried out by Akvaplan-niva AS with ALS Laboratory Group (Czech Republic) as a sub-contractor.

Akvaplan-niva AS is accredited under NS-EN ISO/IEC 17025 by Norwegian Accreditation for field sampling of sediments and fauna, analyses of TOC, TOM, TN, particle size and macrofauna, and for professional evaluations and interpretations. Our Accreditation number is TEST 079.

Czech Accreditation Institute (Lab nr 1163)

ALS Laboratory Group is accredited by the Czech Accreditation Institute (Lab nr 1163) for copper analyses.

Non-accredited services: Analyses of emamectin benzoate, hydrographical measurements and mapping of bottom topography (Olex).

Notes to other results (sediment, pH/Eh, oxygen)			nTOC from 37.3 to 56.3 mg/g. Copper 52.4 mg/kg at C1 Eh positive at all stations O ₂ -conditions were good throughout the water column.

2 Introduction

2.1 Background and aim of the study

On behalf of Arnarlax ehf, Akvaplan-niva completed a C-survey during the time of max biomass at the fish farming site Laugardalur 1 (Figure 1). The survey fulfils the requirements of the Icelandic authorities for bottom surveys according to ISO 12878 and the requirements for environmental bottom surveys (according to Vöktunaráætlun). An environmental study was simultaneously undertaken, with reference to Chapter 5.0 in NS 9410:2016 which follows the methodology for C-study. A C-survey is aimed at studying the environmental conditions of the bottom sediments along a transect sector from the fish farm that extends from the local, to the intermediate and to the regional impact zones. The main emphasis is on the study of the soft bottom fauna which is conducted according to standards ISO 5567-19:2004 and ISO 16665:2014. The obligatory parameters that are included in the survey are described in NS 9410:2016.

A classification or threshold values for this type of survey have not been developed by Icelandic officials so it is not possible to strictly apply the classification based on Norwegian threshold values to Icelandic conditions. We do however report the results with these same indexes with reference to Norwegian threshold values, but it should be emphasized that some of these (such as NSI) are developed according to Norwegian conditions. For further descriptions of these indexes see details in Appendix 1 and Miljødirektoratets Veileder 02:2018.

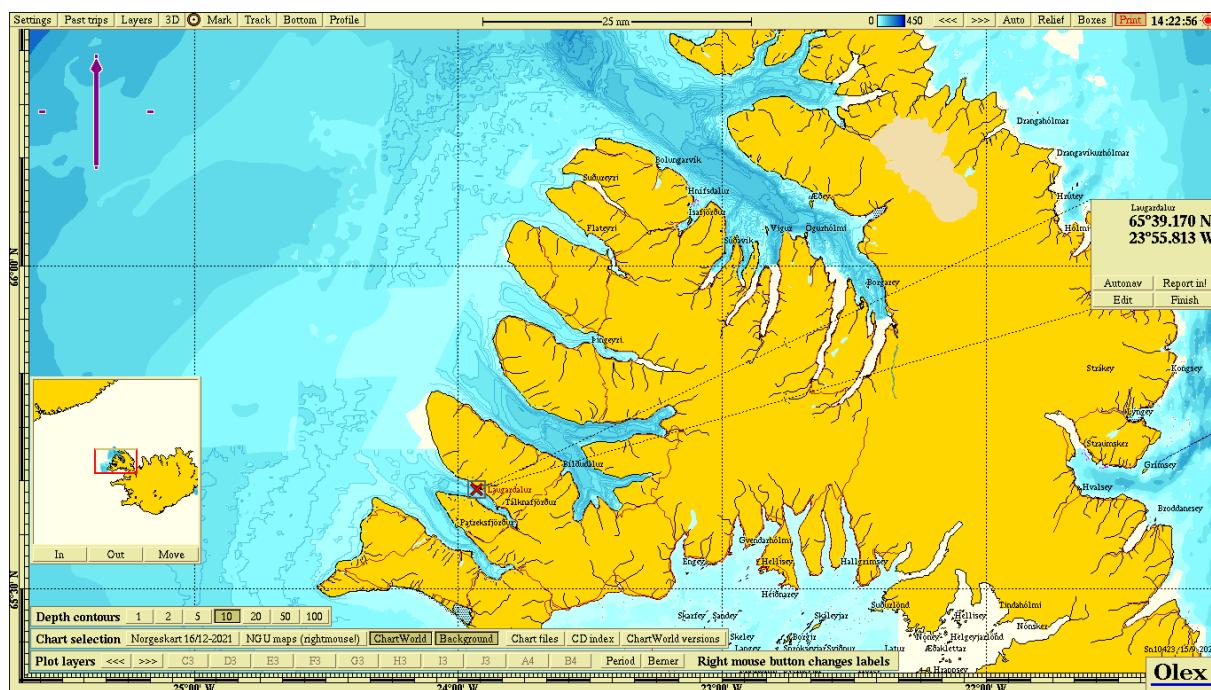

Figure 1. An overview of Westfjords Iceland with the farming site Laugardalur 1 (red cross) in Tálknafjörður. The map coordinates for the midpoint of the farming site are given to the right.

2.2 Site operation and feed use

Laugardalur 1 is located in the northern side of Tálknafjörður, approximately 3 nm northwest of the town of Tálknafjörður. The installed frame is suited for up to 14 net-pens with a circumference of

160 m. The frame is positioned in north-northwest direction from land (297°) with depth below the cages ranging from 24 to 51 m.

The current generation is the third being farmed at the Laugardalur 1 site (previously there were farmed two generation at the old Laugardalur site further into the fjord. At the date of the C-survey the standing biomass was 3.565 tons (pers. comm. Silja Baldvinsdóttir). In Iceland, the MTB (maximum allowed biomass) limit is not given a site level as in Norway. The MTB limit determines how much live fish the holder of the permit can have standing in the sea at any time. In Iceland the allowed production is regulated at two levels, site level and company level. For this site the estimated maximal standing biomass for the next generation is 3.565 tonnes, used as MTB here (Pers. Comm. Silja Baldvinsdóttir).

2.3 Previous surveys

An overview of previous and current C-surveys carried out at Laugardalur 1 is shown in Table 1.

Table 1: Previous and current C-surveys at Laugardalur 1.

Survey date	Report reference (author, year)	Production (tonnes)
12.09 2024	APN 66115.01 (Mannvik and Gunnarsson, current report)	4.320
06.07 2022	APN 64189.01 (Mannvik and Gunnarsson, 2022)	0
25.03 2021	APN 62334.01 (Mannvik and Gunnarsson, 2021)	9.410
27.05 2019	APN 60938.01 (Mannvik and Gunnarsson, 2019)	0
01.11 2017	APN 9207.01 (Velvin and Gunnarsson, 2018)	2.836

3 Materials and methods

3.1 Survey program

The choice of study parameters, placement of sampling stations and other criteria for the study is based on descriptions in NS 9410 (C-surveys). An overview of the planned professional program is given in Table 2.

Akvaplan-niva is accredited for field work, analyses of samples and for the professional evaluation of results in accordance with applicable standards and guidelines ("Veiledere"). For implementation and follow through, the following standards and quality assurance systems were used:

- ISO 5667-19:2004: *Guidance on sampling of marine sediments*.
- ISO 16665:2014. *Water quality – Guidelines for quantitative sampling and sample processing of marine soft-bottom macrofauna*.
- NS 9410:2016. *Miljøovervåking av bunnpåvirkning fra marine oppdrettsanlegg*.
- Internal procedures. *Quality Manual for Akvaplan-niva*.
- Veileder 02:2018 (rev. 2020). *Klassifisering av miljøtilstand i vann*. Norsk klassifiseringssystem for vann i henhold til Vannforskriften. Veileder fra Direktoratgruppen.

Table 2: Survey program for the C-survey at Laugardalur 1, 2024. TOC = total organic carbon. GSA = grain size analysis sediment. TOM = total organic material. TN = total nitrogen. Cu = Copper. Tot-P = total phosphorous. pH/Eh = acidity and redox potential.

Station	Type analyses/parameters
C1 (local impact zone)	Quantitative analyses of bottom fauna. TOC. GSA, TOM. TN. Tot-P. Cu. pH/Eh.
C2 (transect zone outer)	Quantitative analyses of bottom fauna. TOC. GSA, TOM. TN. Tot-P. pH/Eh.
C3 (transect zone)	Quantitative analyses of bottom fauna. TOC. GSA, TOM. TN. Tot-P. pH/Eh. Emamectin benzoate.
C4 (transect zone, deep area)	Quantitative analyses of bottom fauna. TOC. GSA, TOM. TN. Tot-P. Hydrography/O ₂ . pH/Eh.

Field work was completed on 12.09.2024.

Placement of stations and local conditions

The number of stations was calculated with reference to the sites estimated maximal standing biomass for the first generation which is 3.565 tonnes (used as MTB here). According to the standard four sampling stations should be examined. Depth and position of the stations are given in Table 3 and shown in Figure 2. The stations were placed in the direction of the main oceanic current measured at 42 m depth (Heggem, 2019).

Table 3: Depth, distance between the nearest frame of the fish farm and sampling stations and coordinates for C-stations at Laugardalur 1, 2024.

Station	Depth, m	Distance from frame, m	Position	
			N	W
C1	51	25	65°39.248	23°56.298
C2	42	500	65°39.384	23°56.820
C3	51	125	65°39.264	23°56.417
C4	53	75	65°39.165	23°56.394

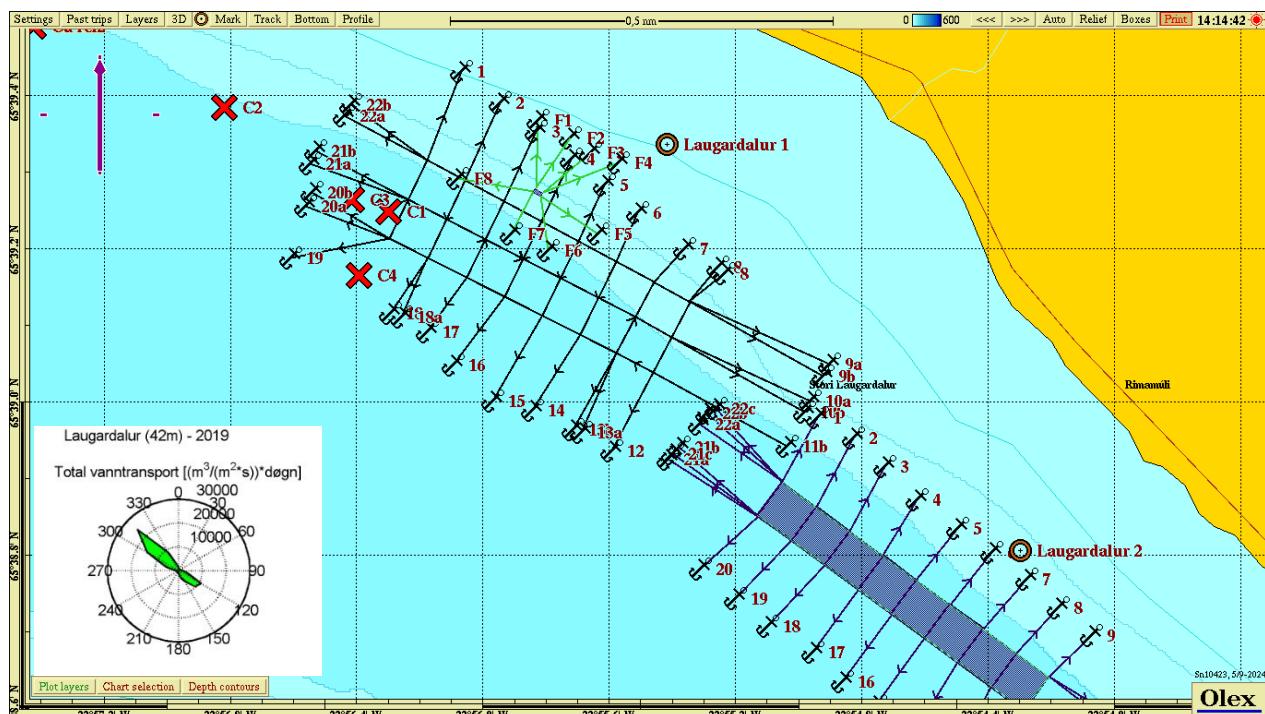

Figure 2. Map showing the sampling stations for the C-survey at Laugardalur 1, 2024. Current measurements used were from 42 m depth (Heggem, 2019).

3.2 Hydrography and oxygen

At station C4, hydrographic measurements, salinity, temperature, density, and oxygen saturation were taken for vertical surface to bottom profiles using a Sensordata CTDO 204 probe.

3.3 Soft bottom sampling and analyses

3.3.1 Fieldwork

Sediment samples were collected with a 0.1 m² bottom grab (van Veen). The sample material was collected through inspection openings. Samples for TOC, TN and Cu were taken from the top 1 cm layer of the sediment and for TOM and grain size analyses from the top 5 cm using a hollow pipe. Only samples with an undisturbed surface were used. The samples were frozen prior to further processing in the laboratory.

3.3.2 Total organic material (TOM)

The amount of TOM in sediment was determined by weight loss after combustion at 495 °C. The percent weight loss was calculated. The reproducibility of the TOM analyses is checked during the analyses by using a standard sediment that contains TOM with a known level. Standard calcium carbonate was burned together with the samples as a control of the amount of carbonate that was not burned in the analyses process.

3.3.3 Total nitrogen (TN)

After drying the samples at 40°C, the amount of total nitrogen (TN) was quantified by electrochemical determination using Akvaplan niva internal method that is based on NS-EN 16168:2012 (Slam, behandlet organisk avfall og jord. Bestemmelse av totalnitrogen ved bruk av tørrforbrenning).

3.3.4 Total organic carbon (TOC) and grain size

The proportion of fine material, the fraction less than 63 µm, was determined gravimetrically after wet sieving of the samples. The results are presented as proportion of each fraction on a dry weight basis (Bale & Kenny, 2005).

After drying the samples at 40 °C, the content of total organic carbon (TOC) was determined by NDIR-detection in accordance with NS EN 17505:2022 (Investigation of solids – Temperature-dependent differentiation of total carbon (TOC₄₀₀, ROC, TIC₉₀₀)). To classify the environmental conditions based on the content of TOC, the measured concentrations are normalized for the proportion of fine substance (nTOC) using the equation: nTOC = TOC + 18 (1 - F), where TOC and F represent a measured TOC value and the proportion of fine substance (%) in the sample (Aure *et al.*, 1993).

3.3.5 Metal analysis - copper (Cu)

The samples for metal analysis were freeze-dried before being placed in a microwave oven in a sealed Teflon container with concentrated ultrapure nitric acid and hydrogen peroxide. The concentration of copper (Cu) was determined by means of ICP-SFMS. The levels of copper are classified in accordance with Icelandic regulation 769:1999.

3.3.6 Emamectin benzoate (EMB)

The sediments were lyophilized prior to solvent extraction. The actual quantification was determined by high-resolution liquid chromatography coupled to tandem mass spectroscopy (HPLC-MS/MS). The LOD and LOQ are determined in accordance with the guidelines of the EU's reference laboratories for pesticide analyses, SANTE/2020/12830, 24/02/2021. The results are evaluated according to the Scottish Environmental Protection Agency (SEPA) standards (SEPA, 2022 & 2023).

3.3.7 Phosphorus (P)

Following a pre-treatment, the samples were quantified according to ČSN 720116-1 (720116) where phosphoruspentaoxide, P₂O₅ forms a phosphorusmolybden-vanadiumcomplex. The samples for

metal analysis were freeze-dried before being placed in a microwave oven in a sealed Teflon container with concentrated ultrapure nitric acid and hydrogen peroxide.

3.3.8 Redox- and pH measurements

At all the stations, a quantitative chemical examination of the sediment was carried out. Acidity (pH) and redox potential (Eh) were measured using electrodes and the YSI Professional Plus instrument. In accordance with the manual of the instrument, 200 mV was added to the measured ORP (the Oxidation Reduction Potential) value.

3.4 Soft bottom fauna investigation

3.4.1 About effect of organic material on bottom fauna

The emission of organic material from fish farms can contribute to the deterioration of conditions for many of the organisms living in the bottom sediment. Negative effects in the bottom fauna can best be assessed through quantitative bottom fauna analyses. Many soft bottom species have low mobility, the fauna composition will largely reflect the local environmental conditions. Changes in the bottom fauna communities are a good indication of unwanted organic loads. Under natural conditions, the communities typically consist of many species. High number of species (diversity) is, amongst other things, that is dependent on favourable conditions for the fauna. However, moderate increases in organic load can stimulate the fauna and result in an increased number of species found. Larger organic loads can result in less favourable conditions where opportunistic species increase their individual numbers, while the species not suited are knocked out resulting in a reduced diversity of species. Changes in species diversity near emission points of feed and faecal matter can, to a large degree, be attributed to changes in organic content (from the feed and faecal matter) in the sediment.

3.4.2 Sampling and fixation

All the bottom fauna samples were taken with a 0.1 m² van Veen grab. Only grab samples where the grab was completely closed and the surface undisturbed were approved. The contents were washed through a 1 mm sieve and the remaining material fixed with 4 % formalin with Bengal Rose dye added and then neutralized with borax. In the laboratory, the animals were sorted from the remaining sediment.

3.4.3 Quantitative bottom fauna analysis

At all stations, two samples (replicates) were collected in accordance with guidelines in NS 9410 (2016). After sorting the sample material was processed quantitatively. The bottom fauna was identified to the lowest taxonomic level possible and quantified by specialists (taxonomists). The quantitative lists of species were statistically analysed. See Appendix 1 for description of analysis methods. The following statistical methods were used to describe community structure and to assess the similarity between different communities:

- Shannon-Wiener diversity index (H')
- Hurlbert's diversity index (ES_{100}) – expected number of species pr. 100 individuals
- Pielou's evenness index (J)

- Sensitivities index (\emptyset mfintlighet) (ISI₂₀₁₈), unsuitable at low individual/species number
- Sensitivity index (NSI₂₀₁₈)
- Composite index for diversity of species and sensitivity (NQI1)
- Sensitivities index which is included in NQI1 (AMBI)
- Normalized EQR (nEQR)
- Number of species plotted against the number of individuals in geometric classes
- Cluster analyses
- The ten most dominant taxa per station (top-ten)

4 Results

4.1 Hydrography and oxygen

The hydrographical profile for the deep station C4 in September 2024 is presented in Figure 3.

Temperature increased from 9 °C at the surface to 10 °C in the bottom layer. Oxygen saturation was 94 % in the upper layer and 82 % in the bottom layer.

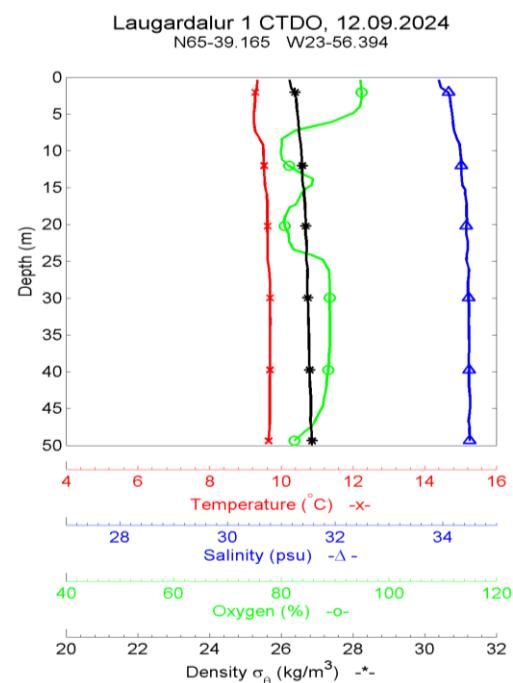

Figure 3. Vertical profiles. Temperature, salinity, density, and oxygen at C4 at Laugardalur 1, 2024.

4.2 Sediment

4.2.1 TOC, TOM, TN, C/N, grain size and pH/Eh

Levels of total organic material (TOM), total organic carbon (TOC), total nitrogen (TN), C/N-relationship, grain size distribution in sediment (pelite) and pH/Eh in the sediment are presented in Table 4.

TOM-levels varied from 9.0 to 11.5 %. TN-levels were low (4.2 – 5.8 mg/g) as was the C/N-ratio. TOC was rather high at all stations and nTOC varied from 37.3 to 56.3 mg/g TS. The bottom sediments grain size was moderately fine to fine with a pelite ratio ranging from 52.6 to 81.6 %.

Redox measurements (pH/Eh) gave a point 0 for all the sampling stations according to Appendix D in NS 9410:2016.

Table 4. Sediment description, TOM (%), TOC (mg/g), TN (mg/g), C/N, grain size distribution (pelite ratio % <0,063 mm) and pH/Eh. Laugardalur 1, 2024.

St.	Sediment description	TOM	TOC	nTOC	TN	C/N	Pelite	pH/Eh
C1	Olive green mud and some silt.	9.0	29	37.3	4.6	6.4	55.9	7.6/258
C2	Olive green mud and some silt.	11.4	52	55.7	5.8	9.1	81.6	7.6/286
C3	Olive green mud. Some dead black algae in sample	10.3	48	56.3	4.6	10.7	52.6	7.6/258
C4	Olive green mud and some silt.	11.5	45	49.9	4.2	10.9	73.2	7.7/293

4.2.2 Copper

Level of copper in bottom sediment at C1 is shown in Table 5. The level of copper was 52.4 mg/kg or low (limit II) according to environmental limits in Icelandic regulation nr. 796/199 (Regulation on prevention of water pollution nr. 796/1999).

Table 5. Copper (Cu), mg/kg DS. Laugardalur 1, 2024.

St.	Cu
C1	52.4

4.2.3 Emamectin benzoate

Concentration of emamectin benzoate in sediment at C3 is presented in Table 6. Station C3 is located 125 m from the cage edge and is thus placed outside the mixing zone (SEPA 2022).

EMB concentration is 550 ng/kg and thus exceeds the defined concentration of 272 ng/kg for stations outside the mixing zone. Accordingly, the station is not fulfilling the "good status standard".

Table 6. Emamectin benzoate in the sediment at C3, ng/kg. Laugardalur 1, 2024.

St.	Emamectin benzoate
C3	550

4.2.4 Phosphorus

Levels of phosphorus in bottom sediments at Laugardalur 1 are shown in Table 7. The level of phosphorus varied from 600 (C1) to 1210 mg/kg (C3).

Table 7. Phosphorus (P), mg/kg DS. Laugardalur 1, 2024.

St.	P
C1	600
C2	900
C3	1210
C4	1190

4.3 Soft-bottom fauna

4.3.1 Faunal indices

Results from the quantitative soft bottom faunal analyses at the C-stations are presented in Table 8.

The number of individuals varied from 494 (C1) to 2683 (C2) and number of species from 32 (C1 and C3) to 74 (C2). The diversity H' varied from 2.70 to 3.55. At most of the stations, the overall index of nEQR was below than 0.6, while at C2 above 0.6. The nEQR values indicate good condition at C2 and not so good conditions at the other stations.

J (Pielous evenness index) is a measure of how equally individuals are divided between species and will vary between 0 and 1. A station with low value has a "crooked" individual distribution between the species, indicating a disturbed bottom fauna community. The index varied from 0.55 to 0.61 which indicates a somewhat uneven distribution.

Table 8. Number of species and individuals pr. 0,2 m². H' = Shannon-Wiener's diversity index. ES₁₀₀ = Hurlberts diversity index. NQI1 = overall index (diversity and sensitivity). ISI₂₀₁₂ = sensitivity index. NSI = sensitivity index. J = Pielous evenness index. AMBI = AZTI marine biotic index (part of NQI1). nEQR = normalized EQR. C-stations at Laugardalur 1, 2024.

St.	No. of individuals.	No. of species	H'	ES ₁₀₀	NQI1	ISI ₂₀₁₂	NSI	nEQR	AMBI	J
C1	494	32	2.71	15.9	0.702	4.35	21.65	0.531	1.88	0.60
C2	2683	74	3.55	21.4	0.761	6.79	23.45	0.656	1.65	0.61
C3	505	32	2.70	15.5	0.697	4.63	21.96	0.534	1.85	0.61
C4	2567	43	2.87	14.6	0.726	5.61	23.65	0.579	1.63	0.55

4.3.2 NS 9410 Evaluation of the bottom fauna at station C1 (local impact zone).

According to NS 9410 the classification of the environmental status in the local impact zone can also be evaluated based on the number of species and their dominance in the bottom faunal community (see Chapter 8.6.2 in NS 9410:2016).

The soft bottom communities were classified to environmental condition 1 "Very good". The criteria for condition 1 are that there are at least 20 species/0.2 m² and that none of these are in numbers exceeding 65 % of the individuals (Table 9).

Table 9. Classification of the environmental status of the soft bottom fauna at station C1 at the Laugardalur 1 site 2024.

Station	Site name	Num. species	Dominating taxa	Environmental condition-NS 9410
C1	Laugardalur 1	32	Galathowenia oculata – 48 %	1 – Very good

Geometric classes

Figure 4 shows the number of species plotted against the number of individuals, where the number of individuals is divided into geometric classes. For an explanation of the concept of geometric classes is given in Appendix 1.

Most of the curves started relatively low (≤ 15 species) while at C2 the curve started higher (20 species). All stretched out in varying degrees towards higher classes and did not give any clear indications of fauna condition.

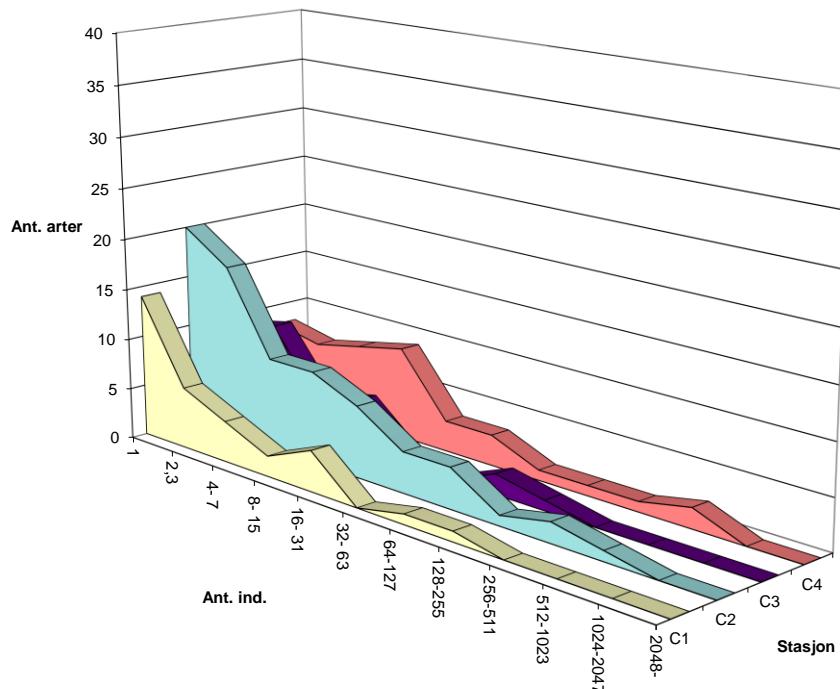

Figure 4. The soft bottom fauna shown as number of species against number of individuals pr. species in geometric classes. Laugardalur 1, 2024.

4.3.3 Cluster analyses

To investigate the similarity of the faunal composition between the sampling stations, the multivariate technique cluster analysis was used. The results of this are presented in dendrogram in Figure 5.

The stations were separated into two main groups. The fauna composition at C1 and C3 in one of the groups was 65 % similar while C2 and C4 on the other group was 64 % similar. The two station groups were 48 % similar.

Laugardalur 1 C-survey 2024. Stations without juveniles
Group average

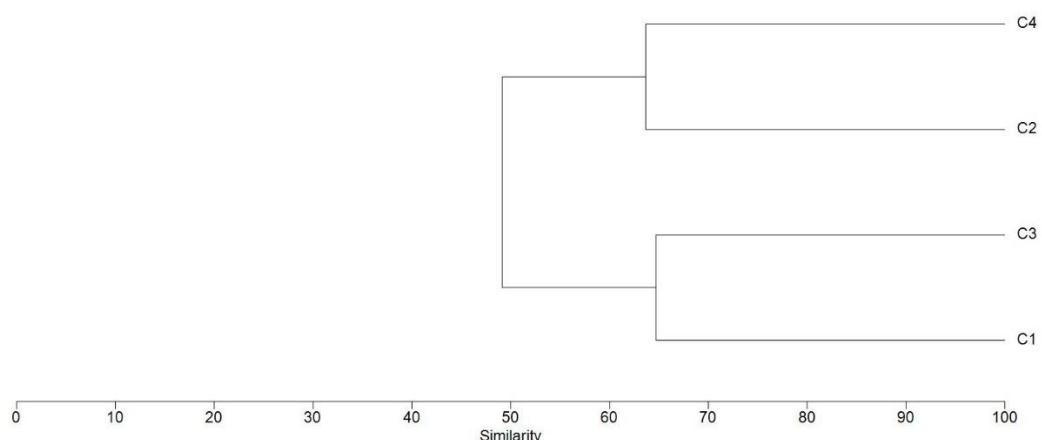

Figure 5. Cluster diagram for the soft bottom fauna at the C- sampling stations at Laugardalur 1, 2024.

4.3.4 Species composition

The main features of the species composition are shown in the form of a top ten species list from each station in Table 10.

In Rygg and Norling (2013) the species are divided into five ecological groups (EG) based on the value of the sensitivity index. These groups run from sensitive species (EG I) to pollution indicators (EG V).

The fauna at C1, C2 and C3 was dominated by the tolerant polychaete *Galathowenia oculata* with between 36 and 48 % of the individuals. The other most dominant species at the stations were a mixture of neutral, tolerant and opportunistic species. One pollution indicator species, the polychaete *Capitella capitata*, was recorded among the top-10 at C1, but with few individuals.

The fauna at C4 were dominated by the neutral polychaete *Owenia* sp. with 41 % of the individuals. The other most dominant species, with known EG, at the station were a mixture of sensitive, tolerant, and opportunistic species.

Table 10. Number of individuals, cumulative percentage, and ecological group* for the ten most dominant species at the C stations. Laugardalur 1, 2024.

C1	EG	Ant. ind.	Kum.
Galathowenia oculata	III	240	48 %
Thyasira sarsii	IV	82	65 %
Ennucula tenuis	III	30	71 %
Pholoe baltica	II	27	76 %

5 Summary and Conclusions

5.1 Summary

The results from the environmental monitoring (type C) at Laugardalur 1, 2024, can be summarised as follows:

- The hydrography measurements showed good oxygen conditions throughout the water column with 82 % saturation in the bottom layer in September 2024.
- TOC was rather high at all stations and nTOC varied from 37.3 to 56.3 mg/g DS. TOM-levels varied from 9.0 to 11.5 %. TN-levels were low (4.2 – 5.8 mg/g) as was the C/N-ratio. The copper level in the sediment at C1 was elevated (52.4 mg/kg) and is categorized into environmental limit II or "low values". EMB concentration at C3 was 550 ng/kg and thus exceeds the defined concentration of 272 ng/kg for stations outside the mixing zone. Accordingly, the station is not fulfilling the "good status standard". The phosphorus levels varied between 600 and 1210 mg/kg. The sediment was moderately fine to fine grained with a pelite share between 52.6 and 81.6 %. The redox measurements (pH/Eh) gave point 0 acc. Appendix D in NS 9410:2016 for all the stations.
- The number of individuals varied from 494 to 2683 and number of species from 32 to 74. The diversity H' varied from 2.70 to 3.55. At most of the stations, the overall index of nEQR was below than 0.6, while at C2 above 0.6. The nEQR values indicate good condition at C2 and not so good conditions at the other stations.

5.2 Conclusions

The results from the monitoring at the farming site Laugardalur 1 in September 2024 showed that the sediment was somewhat loaded with organic carbon and the copper level in the sediment at C1 was somewhat elevated (52.4 mg/kg) and is categorized into environmental limit II or "low values". EMB concentration was 550 ng/kg and thus exceeds the defined concentration of 272 ng/kg for stations outside the mixing zone. Accordingly, the station is not fulfilling the "good status standard".

Some load effects were recorded in the fauna at three stations with faunal index nEQR below 0.6. At C2 the nEQR values was above 0.6 indicating relatively good faunal conditions at this station. The diversity H' varied from 2.70 to 3.55. The NS 9410:2016-assessment of the community in the local impact zone (C1) showed environmental condition 1 (Very good). A pollution indicator species was found among the most dominant species at C1, but not at the other stations.

The redox measurements (pH/Eh) gave point 0 acc. Appendix D in NS 9410:2016 for all the sampling stations. The oxygen saturation in September was good in the whole water column with 82 % in the bottom water.

In comparison with results from previous C-survey at fallow period (Mannvik and Gunnarsson, 2022) the faunal index (nEQR) has decreased at all sampling stations except station C2. In the 2022 survey the nEQR was above 0.6 at all sampling stations but in the present survey nEQR is only above 0.6 at station C2. The diversity index H' ranged from 3.23 – 4.08 at the comparable stations in 2022 survey but are in the current survey under 3 at stations C1, C3 and C4 but at similar level for station C2. The pollution indicator species *Capitella capitata*, which was ranking 3rd among the most dominant species at C1 in 2022, is again registered among the top-10 species at C1 but now ranking in 10th place with only 6 individuals present. In both surveys no pollution indicators were registered at other stations. Overall, the environmental status seems to have somewhat declined during farming of the current generation at Laugardalur 1, based on faunal index score and diversity index values.

7.1 Bunndyrsindeks og artslister

Diversitetsmål

Diversitet er et begrep som uttrykker mangfoldet i dyre- og plantesamfunnet på en lokalitet. Det finnes en rekke ulike mål for diversitet. Noen tar mest hensyn til artsrikheten (mål for artsrikheten), andre legger mer vekt på individfordelingen mellom artene (mål for jevnhet og dominans). Ulike mål uttrykker derved forskjellige sider ved dyresamfunnet. Diversitetsmål er "klassiske" i forerensingsundersøkelser fordi miljøforstyrrelser typisk påvirker samfunnets sammensetning. Svakheten ved diversitetsmålene er at de ikke alltid fanger opp endringer i samfunnsstrukturen. Dersom en art blir erstattet med like mange individer av en ny art, vil ikke det gjøre noe utslag på diversitetsindeksene.

Shannon-Wieners indeks (Shannon & Weaver, 1949) er gitt ved formelen:

$$H' = - \sum_{i=1}^s \frac{n_i}{N} \log_2 \left(\frac{n_i}{N} \right)$$

der n_i = antall individer av art i i prøven

N = total antall individer

s = antall arter

Indeksen tar hensyn både til antall arter og mengdefordelingen mellom artene, men det synes som indeksen er mest følsom for individfordelingen. En lav verdi indikerer et artsfattig samfunn og/eller et samfunn som er dominert av en eller få arter. En høy verdi indikerer et artsrikt samfunn.

Hurlberts diversitetskurver

Grafisk kan diversiteten uttrykkes i form av antall arter som funksjon av antall individer. Med utgangspunkt i total antall arter og individer i en prøve søker man å beregne hvor mange arter man ville vente å finne i delprøver med færre individer. Diversitetsmålet blir derved uavhengig av prøvestørrelsen og gjør at lokaliteter med ulik individetthet kan sammenlignes direkte. Hurlbert (1971) har gitt en metode for å beregne slike diversitetskurver basert på sannsynlighetsberegning.

ES_n er forventet antall arter i en delprøve på n tilfeldig valgte individer fra en prøve som inneholder total N individer og s arter og har følgende formel:

$$ES_n = \sum_{i=1}^s \left[1 - \frac{\binom{N-N_i}{n}}{\binom{N}{n}} \right]$$

der N = total antall individ i prøven

N_i = antall individ av art i

n = antall individ i en gitt delprøve (av de N)

s = total antall arter i prøven

Faunaens fordelingsmønster (Clusteranalyse)

Variasjoner i faunaens fordelingsmønster over området beskrives ved å sammenligne faunasamfunnet på hver stasjon. Til dette brukes multivariate klassifikasjons- og ordinasjons-analyser.

Analysene i denne undersøkelsen ble utført ved hjelp av programpakken PRIMER. Inngangsdata er individantall pr. art, pr. prøve. Prøvene kan være replikater eller stasjoner. Det tas ikke hensyn til hvilke arter som opptrer. Forut for klassifikasjons- og ordinasjonsanalysene ble artslistene dobbelt kvadratrot-transformert. Dette ble gjort for å redusere avviket mellom høye og lave tetthetsverdier og dermed redusere eventuelle effekter av tallmessig dominans hos noen få arter i datasettet.

For å sammenligne prøvene ble Bray-Curtis ulikhetsindeks benyttet (Bray & Curtis, 1957):

$$d_{ij} = \frac{\sum_{k=1}^n |X_{ki} - X_{kj}|}{\sum_{k=1}^n (X_{ki} + X_{kj})}$$

der n = antall arter sammenlignet
 X_{ki} = antall individ av art k i prøve nr. i
 X_{kj} = antall individ av art k i prøve nr. j

Indeksen avtar med økende likhet. Vi får verdien 1 hvis prøvene er helt ulike, dvs. ikke har noen felles arter. Identiske arts- og individtall vil gi verdien 0. Prøver blir gruppert sammen etter graden av likhet ved å bruke "group-average linkage". Forholdsvis like prøver danner en gruppe (cluster). Resultatet presenteres i et trediagram (dendrogram).

Sensitivitet og tetthet

NSI (Norwegian Sensitivity Index; Rygg og Norling 2013) er utviklet med basis i norske faunadata og innført i 2012 og oppdatert i 2018 (Borgersen *m. fl.*, 2019). Hver art av i alt 583 arter er tilordnet en sensitivitetsverdi. En prøves NSI-verdi beregnes ved gjennomsnittet av sensitivitetsverdiene av alle individene i prøven. Formelen for utregning er gitt ved:

$$NSI = \sum_i^s \left[\frac{N_i * NSI_i}{N_{NSI}} \right]$$

ISI₂₀₁₈ (Indicator Species Index; Rygg og Norling 2013) er en sensitivitetsindeks. Grunnlaget for beregningen av ISI (Rygg 2002) ble utvidet og artsnomenklaturen standardisert i 2012 og oppdatert i 2018 (Borgersen *m. fl.*, 2019). Hver art er tilordnet en ømfintlighetsverdi. ISI er en kvalitativ indeks som tar hensyn til hvilke arter som er tilstede, men ikke individtallet av dem. En prøves ISI-verdi beregnes ved gjennomsnittet av sensitivitetsverdiene av artene i prøven hvor ISI_i er ISI₂₀₁₈ verdien for arten i og S_{ISI} er antall arter tilordnet sensitivitetsverdier.

$$ISI = \sum_i^s \left[\frac{ISI_i}{S_{ISI}} \right]$$

AMBI (Azti Marine Biotic Index; Borja *m.fl.* 2000) er en sensitivitetsindeks (egentlig en toleranseindeks) der artene tilordnes en toleranseklasse (økologisk gruppe, EG). EG I = sensitive arter, EG II = "indifferent" arter, EG III = tolerante arter, EG IV = opportunistiske arter, EG V = forurensningsindikerende arter. I Norge brukes AMBI bare i kombinasjonsindeksen NQI1 og har derfor ingen egen klassifisering. AMBI er en kvantitativ indeks som tar hensyn til individtallet av artene.

AMBI = (0 * EG I) + (1,5 * EG II) + (3 * EG III) + (4,5 * EG IV) + (6 * EG V) hvor EGI er andelen av individer som tilhører gruppe I, etc. Tallene angir toleranseverdiene.

Formelen for beregning av en prøves AMBI-verdi er gitt ved:

$$AMBI = \sum_i^S \left[\frac{N_i * AMBI_i}{N_{AMBI}} \right]$$

Sammensatt indeks

NQI1 (Norwegian Quality Index; Rygg 2006) inneholder indikatorer som omfatter sensitivitet (AMBI), og arts mangfold (S = antall, N = antall individer) i en prøve. NQI1 er interkalibrert mellom alle land som tilhører NEAGIG. NQI1 er gitt ved formelen:

$$NQI1 = \left[0,5 * \left(1 - \frac{AMBI}{7} \right) + 0,5 * \left(\frac{\ln(S)}{\ln(\ln(N))} \right) * \left(\frac{N}{N+5} \right) \right]$$

Kunde:	Arnarlax	Rapport nr.:	P240174
Kundemerking:	Laugardalur		
Kontaktperson:		Rapportdato	2024-12-10
Prosjektnr.:	66115	Ankomst dato:	2024-09-06

Lab-id. P240174-18

Objekt	Prøvestasjon/ID	ASC-stasjon	FU-stasjon	Prosjektnr. og prosjektnavn	Notering	Mottatt lab
Sediment	Cu ref 1			66115 - Laugardalur 1 ASC C and B survey max biomass 2024		2024-09-06

Analyseresultat

Parameter	Resultat	Enhet	Analysedato start	Analysedato slutt	Standard	Måleusikkerhet
Kobber (Cu) ^a	45.5 43.6	mg/kg TS	2024-12-01	2024-12-03	Intern metode	

^a Prøvingen er utført av eksternt laboratorium, ALS Laboratory Group

Lab-id. P240174-19

Objekt	Prøvestasjon/ID	ASC-stasjon	FU-stasjon	Prosjektnr. og prosjektnavn	Notering	Mottatt lab
Sediment	Cu ref 2	Cu ref 2		66115 - Laugardalur 1 ASC C and B survey max biomass 2024		2024-09-06

Analyseresultat

Parameter	Resultat	Enhet	Analysedato start	Analysedato slutt	Standard	Måleusikkerhet
Kobber (Cu) ^a	33.8 38.7	mg/kg TS	2024-12-01	2024-12-03	Intern metode	

^a Prøvingen er utført av eksternt laboratorium, ALS Laboratory Group

Lab-id. P240174-20

Objekt	Prøvestasjon/ID	ASC-stasjon	FU-stasjon	Prosjektnr. og prosjektnavn	Notering	Mottatt lab
Sediment	Cu ref 3	Cu ref 3		66115 - Laugardalur 1 ASC C and B survey max biomass 2024		2024-09-06

Analyseresultat

Parameter	Resultat	Enhet	Analysedato start	Analysedato slutt	Standard	Måleusikkerhet
Kobber (Cu) ^a	44.2 41.6	mg/kg TS	2024-12-01	2024-12-03	Intern metode	

^a Prøvingen er utført av eksternt laboratorium, ALS Laboratory Group

Analysene gjelder bare for de prøver som er testet. De oppgitte analyseresultat omfatter ikke feil som måtte følge av prøvetagningen, inhomogenitet eller andre forhold som kan ha påvirket prøven før den ble mottatt av laboratoriet. Rapporten får kun kopieres i sin helhet og uten noen form for endringer. En eventuell klage skal leveres laboratoriet senest en måned etter mottak av analyseresultat. Nærmere informasjon om analysemetoden (måleusikkerhet, metodeprinsipp etc.) fås ved henvendelse til Akvaplan-Niva AS.
